

“The input we received from our Rural and Critical Access Hospital Partner Chief Executive Officers, Directors of Nursing, and Hospital staff personnel during the design charette process was critical in achieving our goal of developing a replacement hospital system that provides great functional flow, efficient staff utilization, significant cost savings to the client...all without sacrificing aesthetics or quality.”

Rick Geiler, AIA
Vice President
Critical Access Group, LLC

The Valueflex/RHS system was developed in conjunction with Critical Access and Rural Hospitals across the country to meet the need of making well-designed replacement hospital facilities available to the rural community and at the same time recognizing the need to provide exceptional value to each client while retaining each client's need for flexibility.

The Valueflex/RHS was developed for:

- + Efficient organization and utilization of hospital staff and resources.
- + Efficient layout of functional spaces
- + Efficient coordination of Building Code and Design requirements.
- + Efficient means, methods and techniques of construction.
- + Flexibility of choice to clients through multiple options and selections.

Some of the many benefits of the Valueflex/RHS and the Valueflex/RHS + are:

- + Efficient Space utilization providing reduced staffing requirements and maximizing reimbursement levels.
- + Focus on Patient Care and Safety by providing a well-designed wellness environment including: all private rooms with private accessible bathrooms, all patient rooms have extended dimensions to allow staff/family access, bariatric rooms allow additional patient safety.
- + Attention to design and construction details yields a tremendous value in construction dollars, yet allows each client flexibility in choosing available options.
- + Attention to public spaces to allow adequate access to outpatient and inpatient areas without confusion.
